

Father Scott Announces A Revised Chemistry Course

A completely revised course of studies will be presented to chemistry majors next year. This was announced recently by Reverend William A. Scott, S.J., Dean of Faculty. A major in political science was announced several weeks ago.

Under the new program in chemistry, the student will complete his study of the four basic divisions of the course: general inorganic, organic, physical and analytic chemistry, by the end of his junior year. His record will then be reviewed by the chemistry department, which will decide if the student should be allowed to take further courses in chemistry.

If the student is allowed to continue he will take six hours of electives in chemistry during his senior year.

Those who are not allowed to continue their study of chemistry will take six hours of electives in any other field during his senior year.

In either case, the student will receive a bachelor of science degree in chemistry. The student who takes the chemistry electives in his senior year, however, will be further recognized in that his degree will be one in professional chemistry. This will be especially helpful to the student who plans to go on for further study in chemistry.

Another change in the course will be the reversing of the organic and analytic chemistry courses. Under the new program, the former will be studied in sophomore year, and the latter will become a part of the junior-year studies.

The major in political science is open to qualified students in the Divisions of the Humanities and of the Social Sciences and leads to the A.B. and B.S. degrees, depending on the course content of the individual student's core curriculum.

It prepares the student for entrance into graduate school; it is an excellent background for law, teaching, and journalism; entry into active politics and government service is facilitated; finally, the program is fitted to the student in search of a liberal college education.
